2. Glue small flaps to the big flap first,
and then the big photo flap to close the bottom.

F-PROT PROFESSIONAL

F-PROT Professional anti-virus software extends virus protection to the whole organization. Its virus identification capability is superb and it is extremely fast. F-PROT Professional can be fully automated, it functions in all common network environments, it removes nearly all viruses that can be removed in the first place, and uses heuristic analysis and change detection features to find also new, unknown viruses.

F-PROT Professional comes with a one year update service, regular Virus Newsletters, Hot-Line and On-line Support and Extensive Documentation.

DOS

F-PROT Professional for DOS provides ease of use combined with a set of sophisticated scanning methods, resident background scanning program and integrity checking program. It can be used in any PC running DOS 2.11 or above.
The DOS version can also be used directly from the diskette.

Windows

F-PROT Professional for Windows is both easy to use and adaptable. The program functions in the background and contains extensive scheduling features. It can also be configured to scan the computer while it is idle. F-PROT Professional for Windows is designed with network environments in mind, but can be used on a stand-alone machine as well.
A unique Windows device driver provides totally transparent protection for all Windows users and automatically informs the administrator when a virus is detected in any workstation.

OS/2

The 32-bit version of F-PROT Professional for OS/2 is a graphical version for Presentation Manager. The 32-bit OS/2 version and the Windows version are functionally almost identical and communicate directly with each other. The 16-bit text mode version can be used either directly from the command line, or through of a batch file and it works also under OS/2 v1.x.

Novell NetWare

NET-PROT is the NLM version of F-PROT Professional.
The NET-PROT NLM scans file reads and writes as they occur and initiates the specific action (move, delete, notify, etc.).
This prevents infected programs and files from executing or loading on your NetWare server.
